

Suite practical guide

One project, several tools — from patch preparation to live operation

StageFlow · Save My Time · Dante Config Editor · StageMark · StageMon

Windows edition · 2026

SiLeMIO / By Mamat---[]---

The idea in one minute

Every application in the range works on its own. As soon as several tools open the same .stageflow folder, they share one project without mixing responsibilities. StageFlow is free and optional: it becomes the central console only when you choose to use it.

Who is this guide for?

For people discovering one application and for teams using the whole suite. Start with the short workflow, then open only the chapters that match your role.

Contents

- 1 · Choose a starting point
- 2 · Build the patch
- 3 · Understand the .stageflow project
- 4 · Prepare with specialist applications
- 5 · Use StageFlow as a central console
- 6 · LIVE mode and simultaneous work
- 7 · One QR remote
- 8 · Safety and troubleshooting
- 9 · Quick workflows and reference

1 · Choose a starting point

You may start in StageFlow, in Excel, or directly in the application you need. The result can join the shared project later: installing StageFlow is never mandatory.

Application	Primary role
StageFlow	Patch, groups, A4 Excel, simple plan and coordination
Save My Time	Transfer labels and settings between consoles and audio software
Dante Config Editor	Prepare and validate Dante configurations offline
StageMark	Layout, cues, projection and show control
StageMon	Two live monitor mixes, source selection and patch changes

Three valid workflows

- StageFlow only: build the patch and simple plan, then print group pages.
- One standalone application: create or open its native project, then add a .stageflow project whenever exchange becomes useful.
- The complete suite: prepare the patch, enrich it with Save My Time and Dante Config Editor, then operate with StageMark and StageMon.

Good habit	Give the .stageflow folder a clear show name and keep it inside the backed-up production folder. Do not treat it as temporary data.
------------	---

2 · Build the patch

In StageFlow, choose the number of pairs and groups. The list offers increments of 20, but any allowed value can be typed. Columns stay balanced and group sheets are designed for landscape A4 printing.

Fast entry

- Enter accepts the cell and moves down.
- Tab accepts the cell and moves right.

- Ctrl+C / Ctrl+V copies and pastes like Excel.
- The fill handle extends a value or sequence down the table.

Common pairs and overrides

The “Common to all groups” set holds recurring sources. For every pair in every group, choose whether the common value appears. A local value overrides only that field; other fields may remain inherited.

- Show all enables common pairs for the selected group.
- Hide all removes them from that group without deleting common data.
- Each pair has its own visibility choice.
- Inherited values appear grey and italic; local overrides remain clear.

Before reducing

Reducing the pair count may remove data above the new limit. StageFlow asks for explicit confirmation.

3 · Understand the .stageflow project

A .stageflow project is a structured folder. It contains the manifest, shared patch and application-owned domains. It can be copied, backed up and archived with the rest of the show.

Independence and continuity

- Every application can create, open and save a .stageflow project without StageFlow.
- Someone who owns only Save My Time, StageMark or StageMon can start immediately.
- If another tool is installed later, the same project continues without a global conversion.
- AutoCAD reads the patch and writes only the CAD domain through its connector.

Simultaneous saving

Applications take short locks, then merge independent changes. Two edits to different fields are preserved. If two people change the exact same value, saving is refused and the conflict remains visible: one version never silently overwrites the other.

Remember

The shared project is the source of truth. Excel exports and native projects remain working or exchange tools; they do not automatically overwrite the shared folder.

Excel as a bridge

The StageFlow V3 workbook can be created or imported from StageFlow, Save My Time and StageMon. It carries group count, common pairs, visibility choices and one sheet per group. A hidden technical sheet preserves identifiers for reliable round trips.

- Use Export Excel to obtain a pre-filled template.
- Use Refresh from Excel to reread the same workbook without losing identifiers.
- Each group sheet targets one landscape A4 page when the amount of content allows it.
- Labels are "Balances" in French and "Sound check" in English; "Overrides" means local replacements.

4 • Prepare with specialist applications

Save My Time

Retrieve a patch from a console, audio application or Excel, edit labels, colours and useful settings, then project it to a destination. The application can create the .stageflow project, update its patch and preserve other domains.

Dante Config Editor

Prepare Dante devices, TX/RX channels, subscriptions and validation offline. From a StageFlow project, associate patch lines with a device's RX channels to reuse names. This preparation never acts on the real Dante network without a separate explicit action.

StageMark

Draw the layout, place patch sources, prepare cues and projection. SHOW and BLACKOUT remain visible, and local projection safety always has priority.

StageMon

Prepare two stereo monitor mixes, select sources, change patches and operate monitoring cues. Local level limits, mutes and audio protections cannot be bypassed by StageFlow.

Install only what you need

Choose only the applications required on the workstation. A missing card remains visible but greyed out, with a discreet link to its download page.

AutoCAD

The StageFlow installer can add the AutoCAD 2026 connector. In the SILEMI/O ribbon, the StageFlow Patch palette reads the current project and publishes technical objects to the CAD domain. StageFlow still works without AutoCAD through its simple built-in plan.

5 • StageFlow as a central console

The Ecosystem area displays one card per application: installed or missing, closed, open, on the correct project, manually connected or LIVE. Unneeded cards can be hidden in settings without uninstalling applications.

- Open starts the installed application on the current StageFlow project.
- Connect asks an existing instance to join this project.
- Show brings the existing window to the foreground.
- Two essential shortcuts may appear on a card, such as SHOW / BLACKOUT or Clear cue A / B.
- A refused command explains why; StageFlow never bypasses the owning application's safety confirmation.

6 • LIVE mode and simultaneous work

LIVE is optional. Enable it when applications must follow changes in real time. Disable it when each tool should work at its own pace and save manually.

When LIVE is active

- StageFlow saves after a short delay and publishes the current session.
- Compatible applications detect changes to groups, labels and their relevant domains.
- Simultaneous writes to independent areas are merged.
- A conflict on the same value stops the write and requires a human decision.
- Turning LIVE off deletes nothing; applications simply return to manual operation.

Operational safety

LIVE synchronizes data and project states. It does not start projection, start audio or remove a mute without an explicit command provided by the owning application.

7 • One QR remote

In StageFlow, open Remote control, choose the phone's Wi-Fi or Ethernet network, then click Start. StageFlow saves the project if required, enables LIVE and displays an ephemeral QR code.

The three mobile tabs

- StageFlow: select, add, rename or delete a group with confirmation; edit sources, microphones and comments; choose common pairs; adjust Sound check / Show; save.
- StageMark: display the real StageMark remote with cues, SHOW and BLACKOUT.
- StageMon: display the real StageMon remote with the same controls as its normal remote access.

Module access conditions

StageMark or StageMon must be installed, open on the same project and LIVE session, with its local remote ready. Otherwise the tab stays visible but unavailable and explains what is missing.

Session protection

- The QR contains a random secret recreated on every start.
- Only one phone or browser becomes controller at a time.
- Access is bound to the selected local IPv4 interface.
- Embedded StageMark and StageMon pages accept only the exact StageFlow portal origin.
- Stopping the remote immediately revokes the link.

Trusted network

The portal uses HTTP on the local network. Use trusted Wi-Fi or Ethernet, never forward the port to the Internet, and reject an overly broad firewall rule.

8 • Safety and troubleshooting

An application card is greyed out

- Check that it is installed under its current name: StageFlow, StageMark, StageMon, Save My Time or Dante Config Editor.
- If installed but closed, click Open.
- If open on another project, click Connect and accept the proposal in that application.
- If still unavailable in LIVE, verify the same projectId and session.

The phone cannot reach the QR

- The phone and PC must be on the same local network.
- Choose the correct address in the Remote control window.
- Allow StageFlow only on the private network if Windows asks for firewall access.
- A guest network may isolate devices; use a shared technical network instead.

The project reports a conflict

Do not keep saving in a loop. Read the message, compare the local value with the shared value, then choose to reload or reapply the edit. Other project domains remain protected.

The workbook exceeds one page

It remains printable, but a very long group may need several pages. Reduce pair count, shorten comments or accept extra pages. Excel Print Preview remains the final reference.

What the computer cannot verify alone

An offline project does not prove that Dante subscriptions, cabling, gains, clocking, licences, audio interfaces or real projection are ready on site. Always perform hardware acceptance tests.

When in doubt

Stop LIVE and the remote, save a copy of the .stageflow folder, then investigate outside live operation.

9 • Quick workflows

I only need an Excel patch

Open StageFlow → New → choose pairs and groups → fill common and group data → Export Excel → Create printable workbook.

I start in Save My Time or StageMon

Create or import the patch → choose New StageFlow project → save the .stageflow folder → continue in the same application. StageFlow can be installed later.

I prepare a complete operation

Patch → .stageflow project → Save My Time / Dante Config Editor → StageMark layout → StageMon monitoring → open in StageFlow → LIVE → one QR → hardware acceptance.

StageFlow is free and optional. Install only the tools you need; the shared project is ready to evolve with your team.
